

## Electronic Key Systems

### How it Works

Keytracker's Electronic Key Systems are simple and easy to use:

- Approved user obtains access to computer database by biometric Finger print reader, password, and or proximity reader.
- User interrogates database and selects the keys he wants to use.
- The indicator light on cabinet holding the selected keys will light up and the door to that cabinet will automatically open.
- The keys selected by the user will be indicated by an illuminated panel to which the key is secured.
- The user then selects key(s) that are illuminated.
- When keys are removed the cabinet will sound a warning buzzer to tell user to close cabinet door.
- To return the key(s) to the cabinet after use the user will enter their security access, hit "check in" function on computer screen and return keys to any vacant slot in the cabinet.
- When door is closed the system will automatically read the location of the key into the database.
